

Protecting Your Family in The Information Age

Keep your guard up on sites like Facebook, LinkedIn and Twitter. Scammers are exploiting the trust we have of our connections on these sites to gain access to your accounts and commit fraud.

General Rules for Computer Security:

- If you were not looking for it, then don't download it.
- Keep your software current with the latest updates.
- Don't click on links in emails from unknown senders.
- Be cautious when clicking on links in emails from known senders as their account may have been hijacked.
- Keep your Windows computer protected with anti-virus software that comes with current Windows software or use third party software such as Norton or McAfee.

Current Threats

Fake Notification E-mails

Watch out for fake emails that look like they came from Facebook. These typically include links to phony pages that attempt to steal your login information or prompt you to download malware. Never click on links in suspicious emails. Login to a site directly.

Suspicious Posts and Messages

Wall posts or messages that appear to come from a friend asking you to click on a link to check out a new photo or video that doesn't actually exist. The link is typically for a phony login page or a site that will put a virus on your computer to steal your passwords.

Money Transfer Scams

Messages that appear to come from friends or others claiming to be stranded and asking for money. These messages are typically from scammers. Ask them a question that only they would be able to answer. Or contact the person by phone to verify the situation, even if they say not to call them.

General Online Safety Rules

Be wary of strangers - The internet makes it easy for people to misrepresent their identities and motives. If you interact with strangers, be cautious about the amount of information you reveal.

Be skeptical - People may post false or misleading information about various topics, including their own. Try to verify the authenticity of any information before taking any action.

Evaluate your settings - Use privacy settings. The default settings for some sites may allow anyone to see your profile. Even private information could be exposed, so don't post anything that you wouldn't want the public to see.

Specific Actions to Avoid

1. **Don't click on a message that seems weird.** If it seems unusual for a friend to post a link, that friend may have gotten their site hijacked.
2. **Don't enter your password through a link.** Just because a page on the Internet looks like Facebook, it doesn't mean it is. It is best to go the Facebook login page through your browser.
3. **Don't use the same password on Facebook that you use in other places on the web.** If you do this, phishers or hackers who gain access to one of your accounts may be able to access your other accounts as well, including your bank.
4. **Don't click on links or open attachments in suspicious emails.** Fake emails can be very convincing, and hackers can spoof the "From:" address so the email looks like it's from a social site. If the e-mail looks weird, don't trust it. Delete it.
5. **Don't send money anywhere** unless you have verified the story of someone who says they are your friend or relative.

Ransomware aka Cryptowall

This fraud scheme begins when the victim clicks on an infected advertisement, e-mail, or attachment, or visits an infected website. Once infected with the ransomware, the victim's files become encrypted. In most cases, once the victim pays a ransom fee, they regain access to the files that were encrypted. **Here are three ways to stay protected: Educate computer users about clicking on suspicious links or popups.** Sometimes these come in the form of a package delivery notification from major brand names like Amazon, FedEx or UPS.

Enable popup blockers. Popups are regularly used by criminals to spread malicious software.

Always backup the content on your computer. If you are infected by ransomware, you can have your system wiped clean and then restore your files from your back up. Also, because ransomware can infect all hard drives, disconnect the backup drive when not in use or use cloud backup.

Password Management

Try to use different strong passwords for all your accounts. At a minimum, have different passwords for multiple email accounts, social networking, financial and employer sites.
